

# ENERGY COMMISSION

## ENERGY PROFILE OF DISTRICTS IN GHANA

DECEMBER 2019

## PREFACE

In line with its mandate to secure a comprehensive database for national decision making, the Energy Commission has over the years provided energy statistical documents such as the *National Energy Statistics* which compiles statistics of the various forms of energy annually. This document comprises among other things, the overall national energy consumption of both primary and non-primary forms of energy including wood fuel, petroleum and electricity. The document has become a very important source of energy data for energy policymakers, researchers, students as well as organizations and institutions in the energy field.

It has become necessary to develop an energy database at the district level to provide relevant information for execution of Government programmes at district level such as the “One District One Factory” (1D1F) initiative. The Commission has therefore developed a comprehensive database on the energy profile of the various districts of the country which is the first of its kind in the country, providing information on energy resources and their utilisation at the district level.

This report is organised into five sections. The first section is the introductory portion of the report. The second section deals with renewable energy resources at the district level which are, hydro, solar, wind and biomass. Section 3 covers petroleum resources in the country and Section 4 covers projected residential energy demand at the district level in 2020. The document also provides Annexes of tables which present the number of LPG filling stations, electricity access and 2020 projected household energy demand in the various districts.

It is expected that this report will serve as a source of valuable information for all relevant agencies and institutions in the country including decision makers, policy makers, researchers and investors.

Oscar Amonoo-Neizer  
Executive Secretary

## **1. INTRODUCTION**

The Energy Commission Act, (Act 541)1997, mandates the Commission to among other things, “secure a comprehensive database for national decision making on the extent of development and utilization of energy resources available in the nation”. In line with this, the Commission has over the years been compiling national energy data to assist researchers, policy and decision makers in taking informed decisions on matters relating to energy utilisation in the country.

The compilation of the existing energy data is however usually done at the national level therefore making the available energy resources and energy utilization at the district level unknown. This falls out of line with the manner in which national development projects are executed which is at the district and the local assembly levels. The Government of Ghana has initiated a number of flagship programmes such as the “One District, One Factory,” “One Village One Dam,” and “Planting for Food and Jobs” initiatives. These programmes seek to reinvigorate Ghana’s industrialization process and enhance the country’s socio-economic development efforts through the process of linking agriculture to industry. In the case of the “One District One Factory” initiative, otherwise known as District Enterprises initiative, the Government seeks to establish medium-to-large-scale factories or industrial enterprises that have the potential to fundamentally affect the economy of the districts as well as adding value to the country’s natural resource base.

A comprehensive database on Ghana’s energy profile at the district level, indicating the indigenous energy resources and energy utilisation in the various districts, is therefore essential for national development as this will assist in the development of the necessary policies and strategies for effective energy use in the country. The existence of such a database is expected to help in the development of the necessary strategies for the enhancement of the country’s energy security and the effective implementation of the District Enterprise agenda as well as other Government developmental initiatives. This report presents information on the indigenous energy resources of districts in Ghana, as well as the projected energy use in the various households at the district level in the year 2020. The energy resources covered in the report are small and medium hydro potentials, solar, and wind. The report also presents data on electricity access, charcoal production areas and LPG filling stations in the various districts in the country.

## **2. RENEWABLE ENERGY RESOURCES**

Ghana has a variety of renewable energy resources which are solar, wind, hydro and bioenergy. Woodfuel, a form of biomass, is currently a major source of primary energy in the country. According to current estimates, it is the second largest source of primary energy, coming after petroleum. It constitutes about 38% of primary energy consumption with petroleum constituting about 48%<sup>1</sup>. Almost all the remaining share is taken by hydro. By virtue of its geographical location, which is within the tropical zone, Ghana has abundant solar energy resource. Solar energy has been used for crop drying and other heating purposes over the years and is currently finding increasing use in electricity generation. Currently, the total installed capacity of solar photovoltaic system in the country is 67,218 kW<sup>2</sup>. In addition to solar, wind and municipal waste are also gaining attention in electricity generation. The total installed capacity of wind and municipal waste electric power systems stand at 31 kW and 100 kW respectively<sup>2</sup>. Ghana has a number of river bodies making it rich in hydro resources. Hydro power has been the main source of electricity until it was overtaken by thermal generation sources in 2016. Currently, 6017 GWh of electricity is generated from hydro, representing 37 % of electricity generation with almost all the remaining share taken by thermal sources. This section presents renewable energy resources such as solar, wind and hydro energy resources at the district level. Also presented is the main charcoal production areas in the various districts.

### **2.1 Solar Energy**

Solar irradiation intensity is a measure of the amount of solar energy reaching a surface on the earth. Upon passing through the earth's atmosphere, part of solar radiation is absorbed by the atmosphere whereas the remaining portion is scattered or directly transmitted to the earth surface. The sum of the scattered, transmitted and reflected radiation is called Global Horizontal Irradiation (GHI) and it is the total solar radiation incident on a horizontal surface on earth. The transmitted radiation is referred to as direct normal irradiation (DNI) and it is the amount of radiation received by a surface perpendicular to the sun rays. The scattered radiation is called diffuse horizontal irradiation (DHI). The global horizontal irradiation intensity (GHI) based on a study conducted by

<sup>1</sup> Energy Commission, *National Energy Statistics 2009 to 2018*, p 1., 2019

<sup>2</sup> Energy Commission, *National Energy Statistics 2009 to 2018*, p 8., 2019

SOLARGIS<sup>3</sup> is presented in Figure 1. The GHI intensity in Ghana ranges from 1592 kWh/ m<sup>2</sup> to 2082 kWh/ m<sup>2</sup> per annum (i.e. 4.36 to 5.7 kWh/m<sup>2</sup>/day). The highest irradiation level occurs in the northern portion of the country and generally decreases southwards. Areas with highest intensity are in the Upper West, Upper East and the North East Regions as well as parts of the Savanna and the Northern Regions. The intensity in this zone ranges from 2018 kWh/ m<sup>2</sup>/annum to 2082 kWh/ m<sup>2</sup>/annum (5.5 kWh/ m<sup>2</sup>/day to 5.7 kWh/ m<sup>2</sup>/day). Districts in these regions include Lawra, Jirapa, Nandom, Bolgatanga municipality, Kasena Nankana East and West and Bawku Municipality. The next highest zone covers the North East Region and the upper part of Savannah and Northern Regions with annual irradiance ranging from 1969 kWh/ m<sup>2</sup> to 2017 kWh/ m<sup>2</sup> (i.e., daily irradiation of 5.4 to 5.5 kWh/m<sup>2</sup>). Districts in these regions include Wa East and West, West Mamprusi and Chereponi. This is followed by areas covered by the mid parts of the Savannah and Northern regions with annual intensities in the range of 1920 to 1968 kWh/ m<sup>2</sup> (5.3 to 5.4 kWh/ m<sup>2</sup> daily). Some southern parts of Volta and Greater Accra regions also have such level of solar intensities. The districts in these regions include West Gonja, Tamale North Sub Metro, Yendi Municipality, Keta, and East and West Ada. Districts in the southern parts of, Savannah and Northern Regions as well as the northern part of the Bono East Region have intensities below those mentioned above, falling in the range of 1877 to 1919 kWh/ m<sup>2</sup> /annum (5.1 to 5.3 kWh/ m<sup>2</sup>).

Districts in the middle part of the country such as southern part of Bono East, northern parts of the Ashanti and Eastern Regions have intensities ranging from 1840 to 1876 kWh/ m<sup>2</sup> /annum (5.04 to 5.14 kWh/ m<sup>2</sup>). These intensities fall between the northern and the southern portions of the country. The southern part of the country has the lowest level of solar intensities with a broad range of 1592 to 1839 kWh/ m<sup>2</sup>/annum (4.36 to 5.04 kWh/m<sup>2</sup>). Regions in these areas include Ahafo, Western, Western North, Volta, Central and Greater Accra Regions. The southern portions of Oti, Ashanti, Eastern, and Bono Regions also fall in this solar intensity range. Some of the associated districts are Sefwi-Wiawso, Asutifi North and South, Tarkwa Nsuaam, Mfatsiman, Assin North, Ga East and West, Adansi North and South, Kwaebibirem Atiwa, Birim North and South, Akatsi North and South, Ketu North and South and Adaklu. The mean solar irradiation intensities of all districts in the country are presented in tables 1 to 5.

---

<sup>3</sup> <https://solargis.com/maps-and-gis-data/download/ghana>, 2016

In addition to the global horizontal irradiation which gives the total solar radiation intensities, Figures 2 and 3 give the direct normal irradiation (DNI) and the horizontal diffuse irradiation. The direct normal irradiation intensities are high in the northern portion of the country, decreasing southwards. The reverse is the case of the diffused irradiation which is low in the northern part of the country and high in the southern portion of the country. This is due to the high cloud cover in the southern part of the country as compared to the north.

## DIRECT NORMAL IRRADIATION (DNI)

### SOLAR RESOURCE MAP

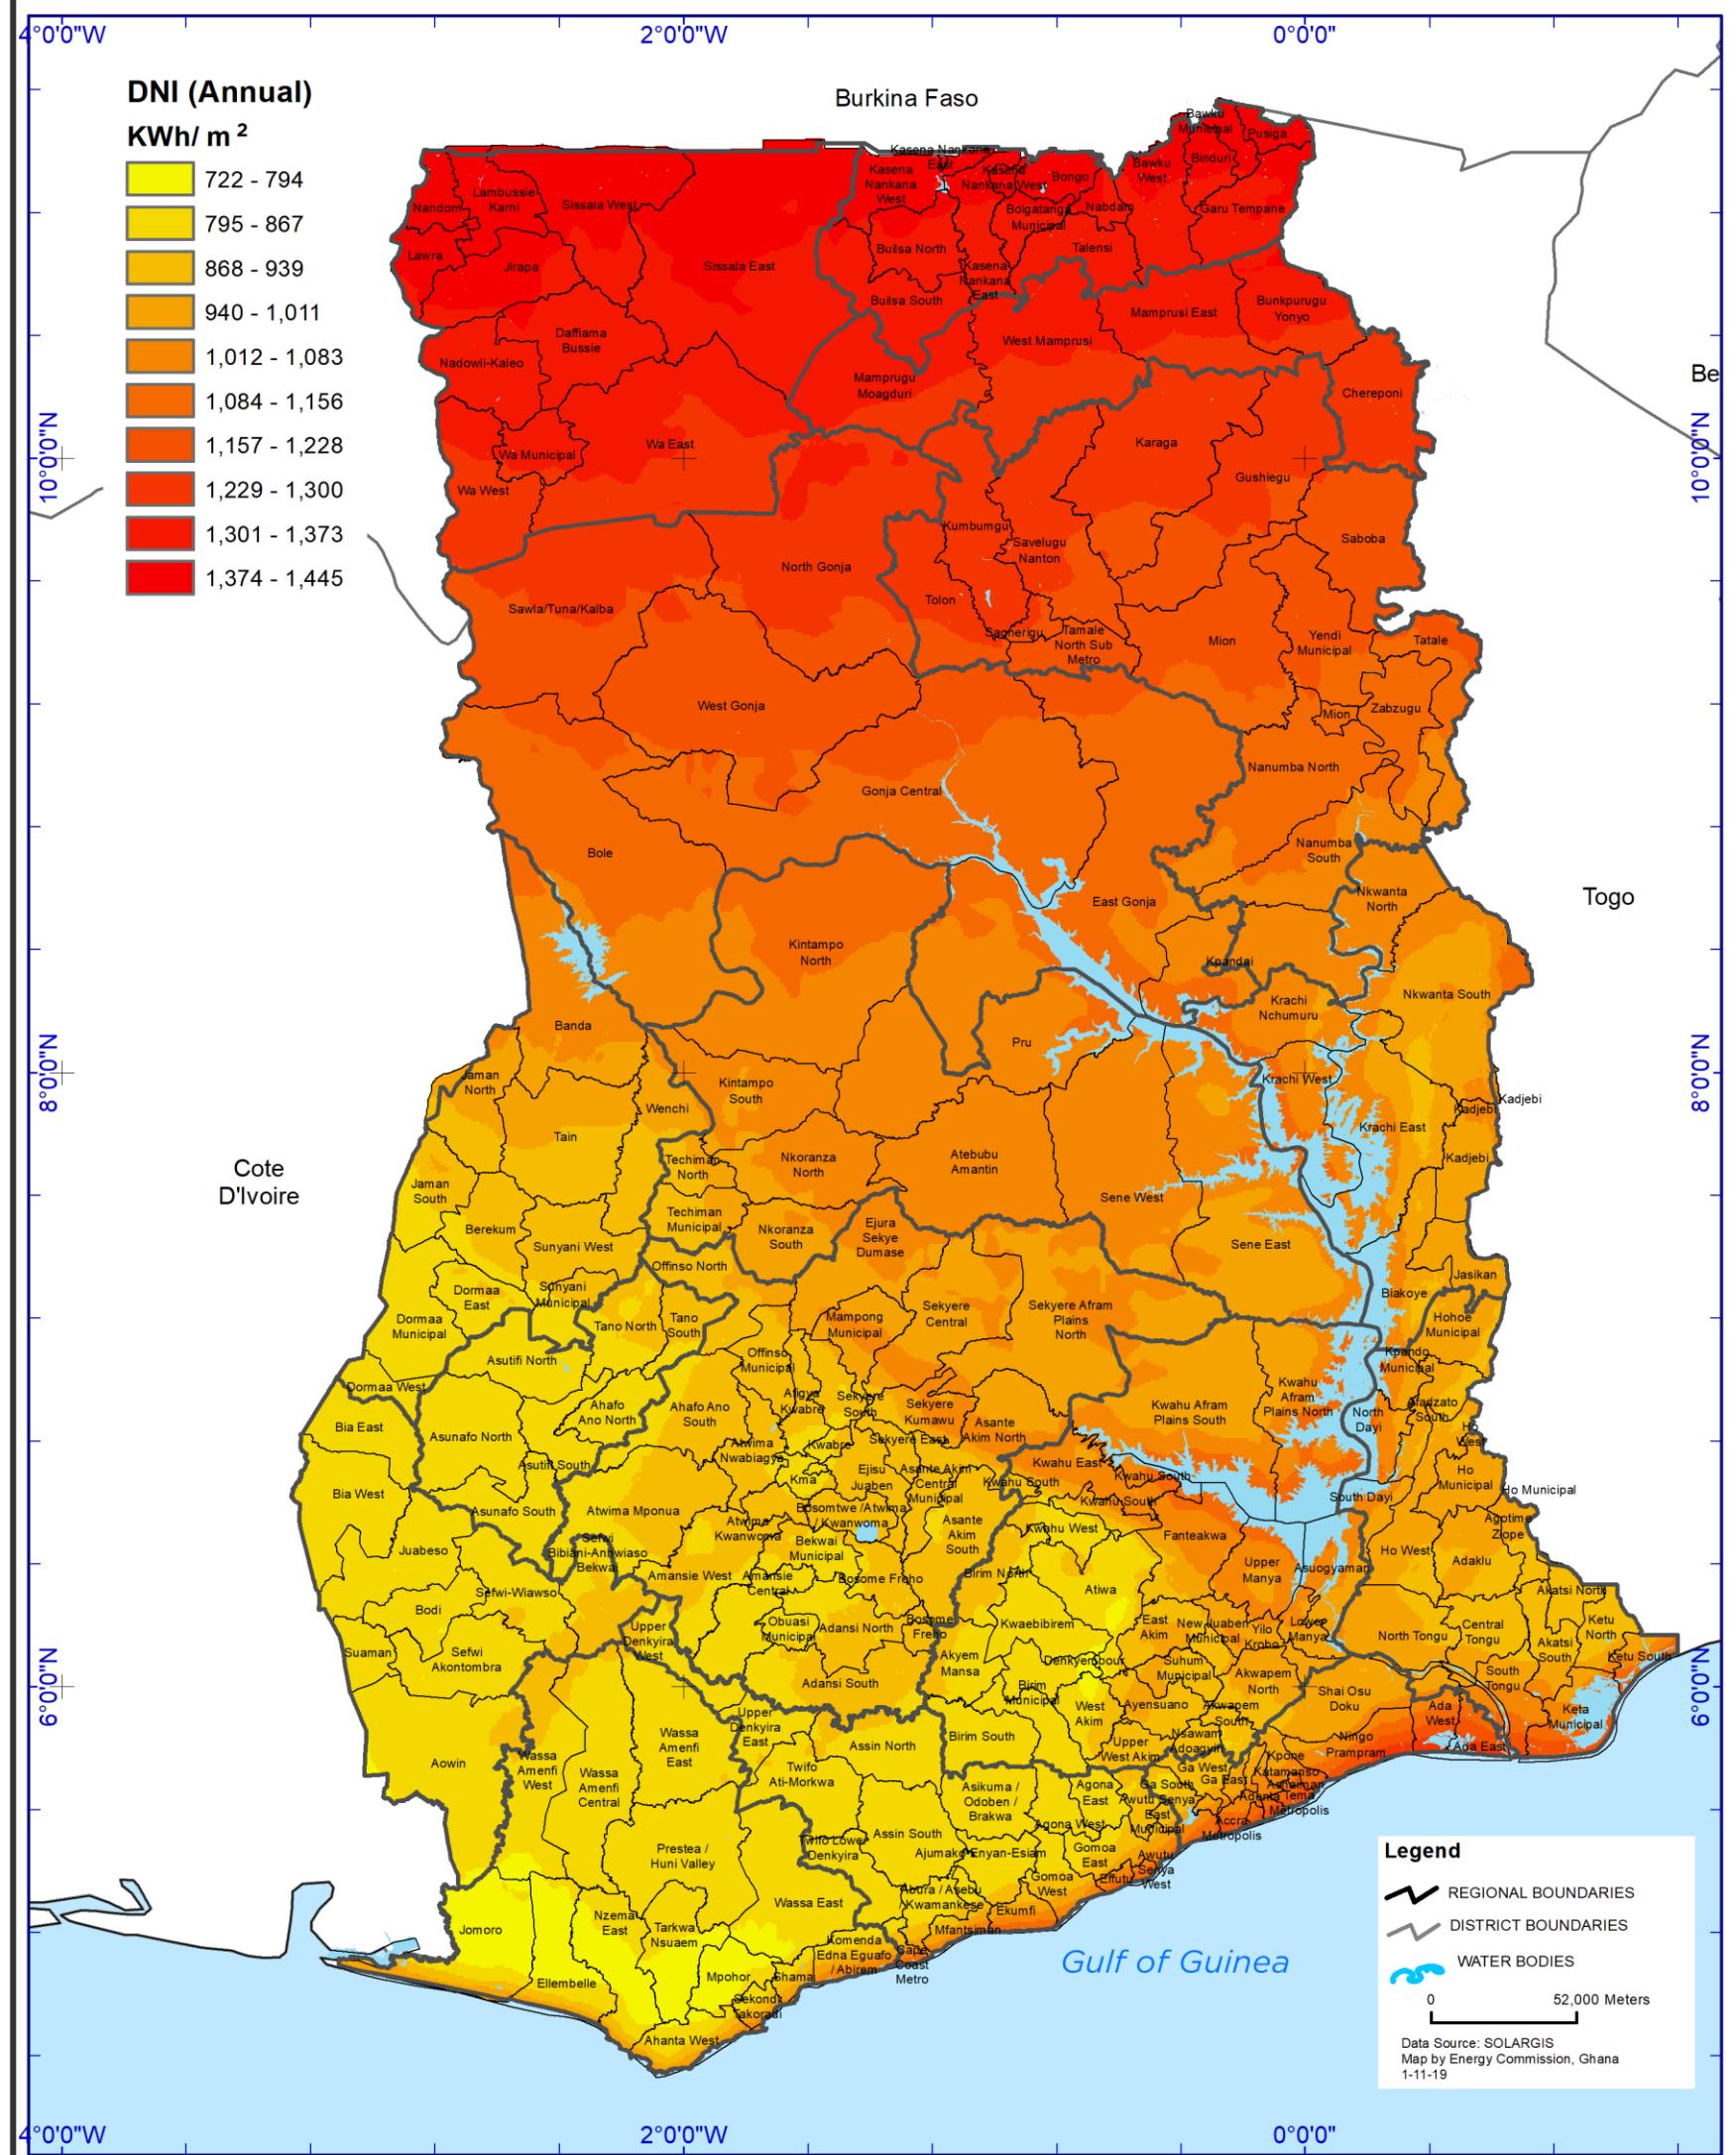

Fig. 2: Direct Normal Solar Irradiation Map

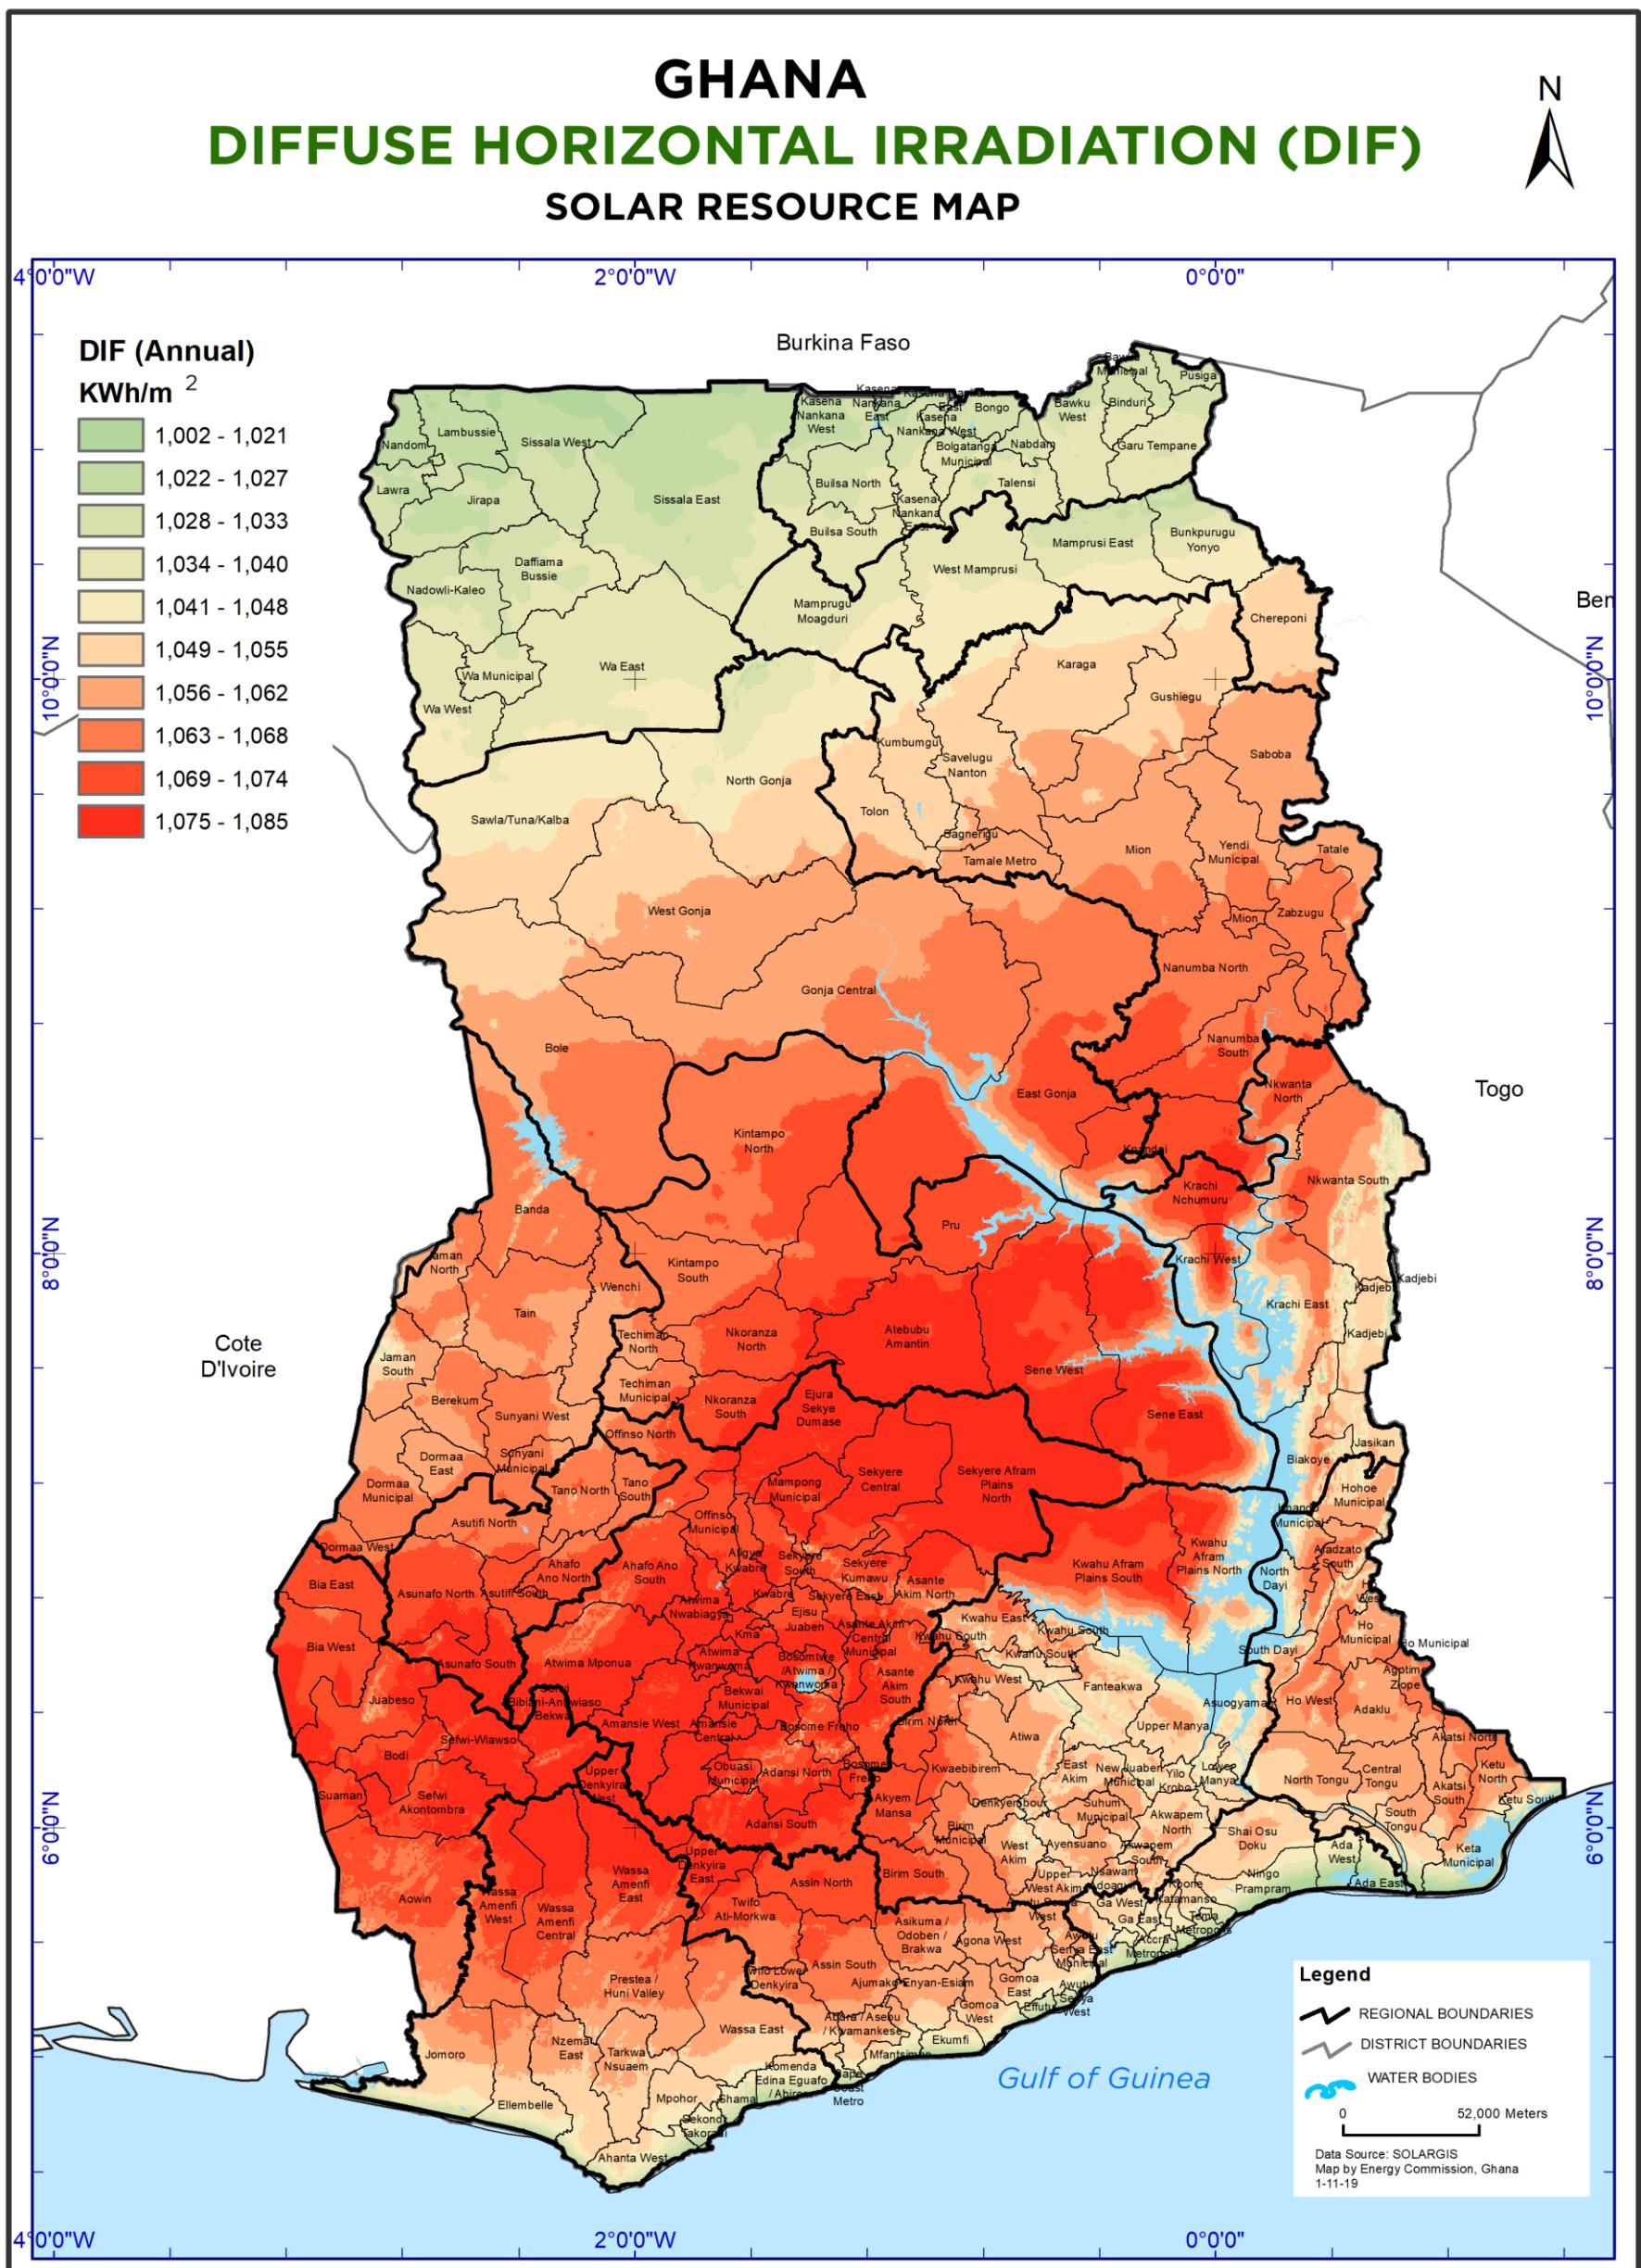

Fig. 3: Diffuse Horizontal Solar Irradiation Map

## **2.2 Wind Energy**

Currently, the total installed capacity of wind electricity generation systems stands at about 31 kW. Most promising areas for deployment of wind power plants are along the mountains in the south-eastern part of the country and along the eastern coastal areas of the country (Figure 4). The average annual wind speed along these areas range from 4.0 m/s to 6.0 m/s at 50 m hub height. The wind regime in other parts of the country is generally low with wind speed in the range of 2-5 m/s. The minimum wind speed for most modern wind turbines is about 3 m/s<sup>4</sup> meaning that most part of the country cannot be used for wind power generation. Districts with wind speeds above 5.3 m/s include Keta Municipality in the Volta Region; Ada East and West in the Greater Accra Region; Mampong Municipal and Ashanti Akim in the Ashanti Region and Kwahu East, Kwahu South, Upper Manya and Fanteakwa in the Eastern Region.

---

<sup>4</sup>[http://www.wind-power-program.com/turbine\\_characteristics.htm](http://www.wind-power-program.com/turbine_characteristics.htm)

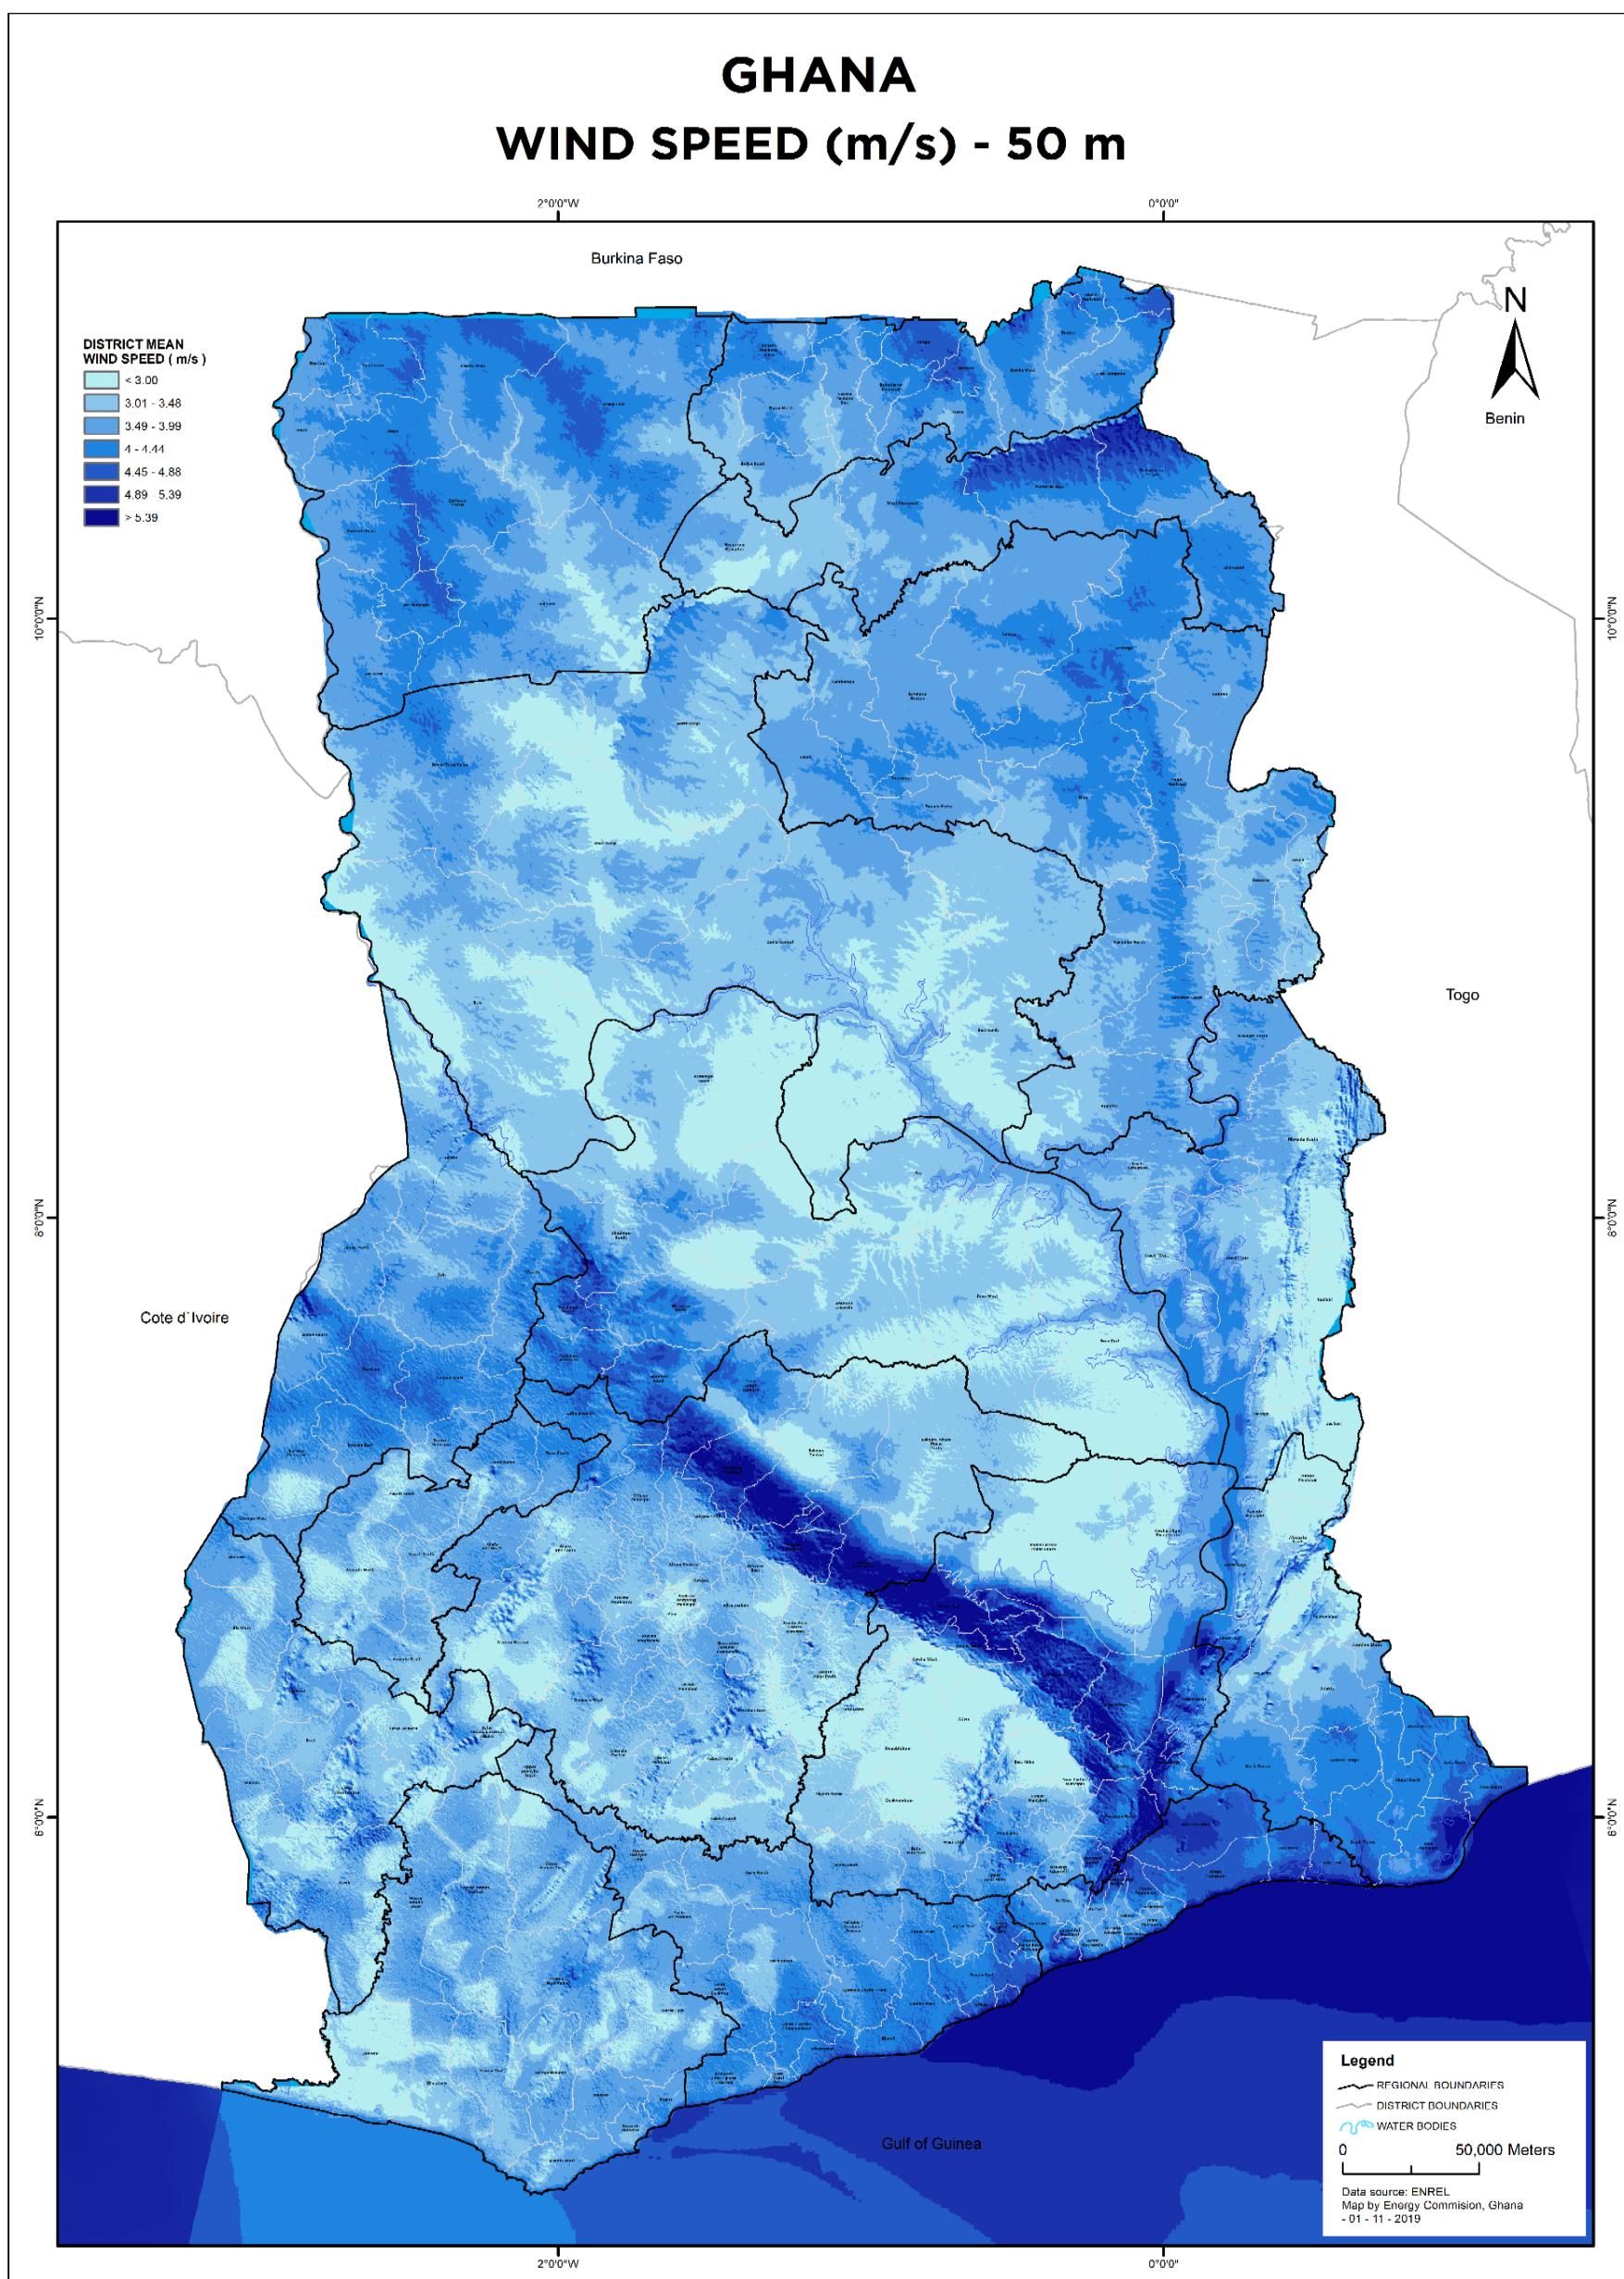

Fig. 4: Wind Resource Map

## 2.3 Hydro

Ghana is drained by a large number of streams and rivers some of which have potential for hydropower generation. Notable among them are the Volta, Tano and Oti. Apart from the Volta, none of the rivers have been utilised for power generation. Hydropower is one of the widely used primary energy sources in the country. Total installed capacity of hydropower in Ghana is 1584 MW<sup>5</sup> and this constitutes about 32% of total installed electricity generation capacity of 4961.5 MW as of December 2018<sup>6</sup>. Almost all the remaining share is taken by thermal plants. The tapped hydro resources comprise, Akosombo in the Asuogyaman District with an installed capacity of 1020 MW, Kpong in the Lower Manya Krobo District with an installed capacity of 160 MW and Bui in the Banda District with an installed capacity of 404 MW.

The total hydro potential is estimated to be about 846 MW and is located at 32 sites in 30 districts (Figure 5). Each of the remaining hydro potential sites has capacity below 100 MW. Notable among the hydro resources are Lanka (95 MW), Juale (90 MW), Hemang (90 MW), Pwalugu (50 MW), Kulpawn (40 MW) and Daboya (40 MW) in Bole, Nkwanta North, Talensi, Shama, Savelugu Nanton and North Gonja Districts respectively. Others include Awisam (50) MW in the Akyem Mansa District, Tanoso (56 MW) in Wassa Amenfi District, Ntereso (64 MW) in Sawla-Tuna-Kalba District and Abatumesu (50 MW) in Twifo Lower Denkyira District. There are also small hydro potential sites with capacity in the kW zone located at in some districts. These include Tsatsadu (30 kW) in Afadzato South District, Sawnu (135 kW) in Asunafo South District and Dodi Papasa (770 kW) in the Nkwanta South District.

## **2.4 Bioenergy**

Bioenergy refers to energy obtained from natural organism such as plants and animals. Ghana's total land area is estimated at 23.9 million hectares (ha) of which 65.7% lies within the savanna zone (SZ) in the north while the remaining 8.2 million ha are within the tropical high forest zone (HFZ) in the south. The savanna zone is characterized by an open canopy of trees and shrubs with a distinct ground layer of grasses. Bioenergy in Ghana include woodfuel and crop residue.

### **2.4.1 Woodfuel**

Woodfuel, refers to woody biomass that can be used as fuel in its natural or raw state. In some cases, woodfuel is processed to other kinds of fuel such as charcoal, briquette, etc. If used in its raw form, it is referred to as firewood or fuel wood. Woodfuel in Ghana is obtained from forest and farmlands and the high dependency on woodfuel as primary energy source has contributed to the depletion of the forest. Currently, data on the amount of woodlot in the country that is available for use as woodfuel does not exist and therefore the necessary studies have to be conducted. The most important source of wood for charcoal production are forests in the transition zone of Ghana<sup>7</sup>.The main charcoal producing areas are shown in Figure 6. According to the figure, the main charcoal production hotspots in the country are Kintampo in the Kintampo North District, Bole in the Bole District and Atebubu in the Atebubu Amantin District.

---

Fig. 6: Main Charcoal Production Areas

## 2.4.2 Crop Residue

There are many kinds of crop residues that can be used as fuel to complement or replace fuel-wood. Some of these residues are maize stalks and cobs, rice straw and husks, groundnut shells and haulms and cassava peels. The amount of residue generated during processing of food crops as well as the energy content can be estimated by using table 6<sup>8</sup>. The estimated amount of some crop residues and their energy contents for the various districts are presented in Tables 6 to 38. Since part of the crop residue is used as manure and animal feed, the amount available for energy usage is far lower than that stated. Data on the amount of crop residue that is used for non-energy purposes is not available and therefore the actual amount of crop residue available for energy purposes remains unknown. In addition, due to the scattered nature of farmlands in Ghana, the cost of transport involved in collecting such residues for energy utilisation is high.

Table 6: Amount of residues per unit mass of agriculture produce and their corresponding energy content

Type of Residue	Ratio of residues to crop volume (t/t)	Energy of residue (MJ/kg)
Maize (cobs & stalks)	1.5	17.65-18.77
Cassava	0.5	14.24
Yam straw	0.5	14.24
Cocoyam straw	0.5	14.24
Rice straw	1.5	16.28
Rice husk	0.25	16.14
Groundnut shells	0.3	10.00-17.00
Groundnut haulms	2	10.00-17.00
Oil Palm shells	0.45	10.00-17.00
Sorghum stalks	1	10.00-17.00
Millet straw	1.2	10.00-17.00

### **3. PETROLEUM RESOURCES**

Ghana's proven oil and gas resources are currently located offshore in the Tano Cape Three Points sedimentary basin. The land bordering this basin comprises the Nzema East, Ahanta West and Sekondi-Tokoradi Districts. The total proven oil reserves is currently estimated to be 1019 million barrels (mmbbls). Some of the oil fields, have associated natural gas deposits. In addition to this, non-associated natural gas deposits have been discovered. The total discovered oil and gas reserves if untapped are estimated to be 1400 million barrels (mmbbls) and 2095 billion cubic feet (Bcf) respectively. The production of oil and gas has caused the reserves to be reduced to 1019 mmbbls and 1936 (Bcf) respectively as at November 2019.

## **4. PROJECTED RESIDENTIAL ENERGY DEMAND FOR 2020**

This section presents the projected residential demand for the various energy commodities at the district level for the year 2020. The energy commodities presented are, firewood, charcoal, electricity, kerosene, and liquefied petroleum gas (LPG). It provides the total demand for the various energy products by households at the district level for the year 2020. The projections for the energy commodities at the district level were based on the Ghana Statistical Service's projected population in 2020 and historical data on the energy consumption patterns of the various communities in the districts provided by the 2000 and 2010 census reports. Since there is a distinction between the energy consumption patterns of urban and rural dwellers, the projected number of urban and rural households in 2020 in the various districts was first determined using the 2000 and 2010 census reports and this was multiplied by the projected quantity of energy commodities consumed per a household in the rural and urban areas to determine their respective residential energy consumption. The quantity of energy commodities used by the urban and rural dwellers per household was based on a survey conducted in 2010 by Energy Commission on energy usage of the various sectors of the economy including that of the residential areas.

### **4.1 Firewood Demand**

The projected residential firewood demand for the various districts can be found in Figure. 7. The district with the highest demand would be the Amansie West in the Ashanti region with a projected demand of 77.5 kt of firewood. This would be followed by Atwima Mponua, Ahafo Ano South, Adansi South and Asante Akim South, all from Ashanti region with expected demand of 71.5 kt, 71 kt, 64.5 kt and 63 kt of firewood respectively. The district that would account for the lowest demand is projected to be Daffiame Bussie in the Upper West region with a firewood demand of 0.3 kt. The Ashanti Region is estimated to be the region with the highest average demand of 32.8 kt for firewood as presented in Table 39, which presents the regional average demand and share of the various regions in descending order of magnitude. Ashanti region would also have the highest share of about 18% of all firewood that would be consumed in the various districts of the country.

Table 39: Average firewood demand and share of the various regions

Region	Average District Demand (kt)	Regional share of total demand (%)
Ahafo	24.7	2.7
Ashanti	32.8	18.1
Bono	19.9	4.0
Bono East	26.6	4.9
Central	26.8	9.8
Eastern	27.2	12.9
Greater Accra	8.3	2.4
North East	29.5	2.7
Northern	26.9	7.5
Oti	29.1	4.3
Savannah	26.1	2.9
Upper East	25.4	6.0
Upper West	25.0	5.0
Volta	29.1	9.1
Western	21.2	5.8
Western North	15.1	1.9

## GHANA 2020 ENERGY DEMAND PROJECTION TOTAL RESIDENTIAL FIREWOOD DEMAND

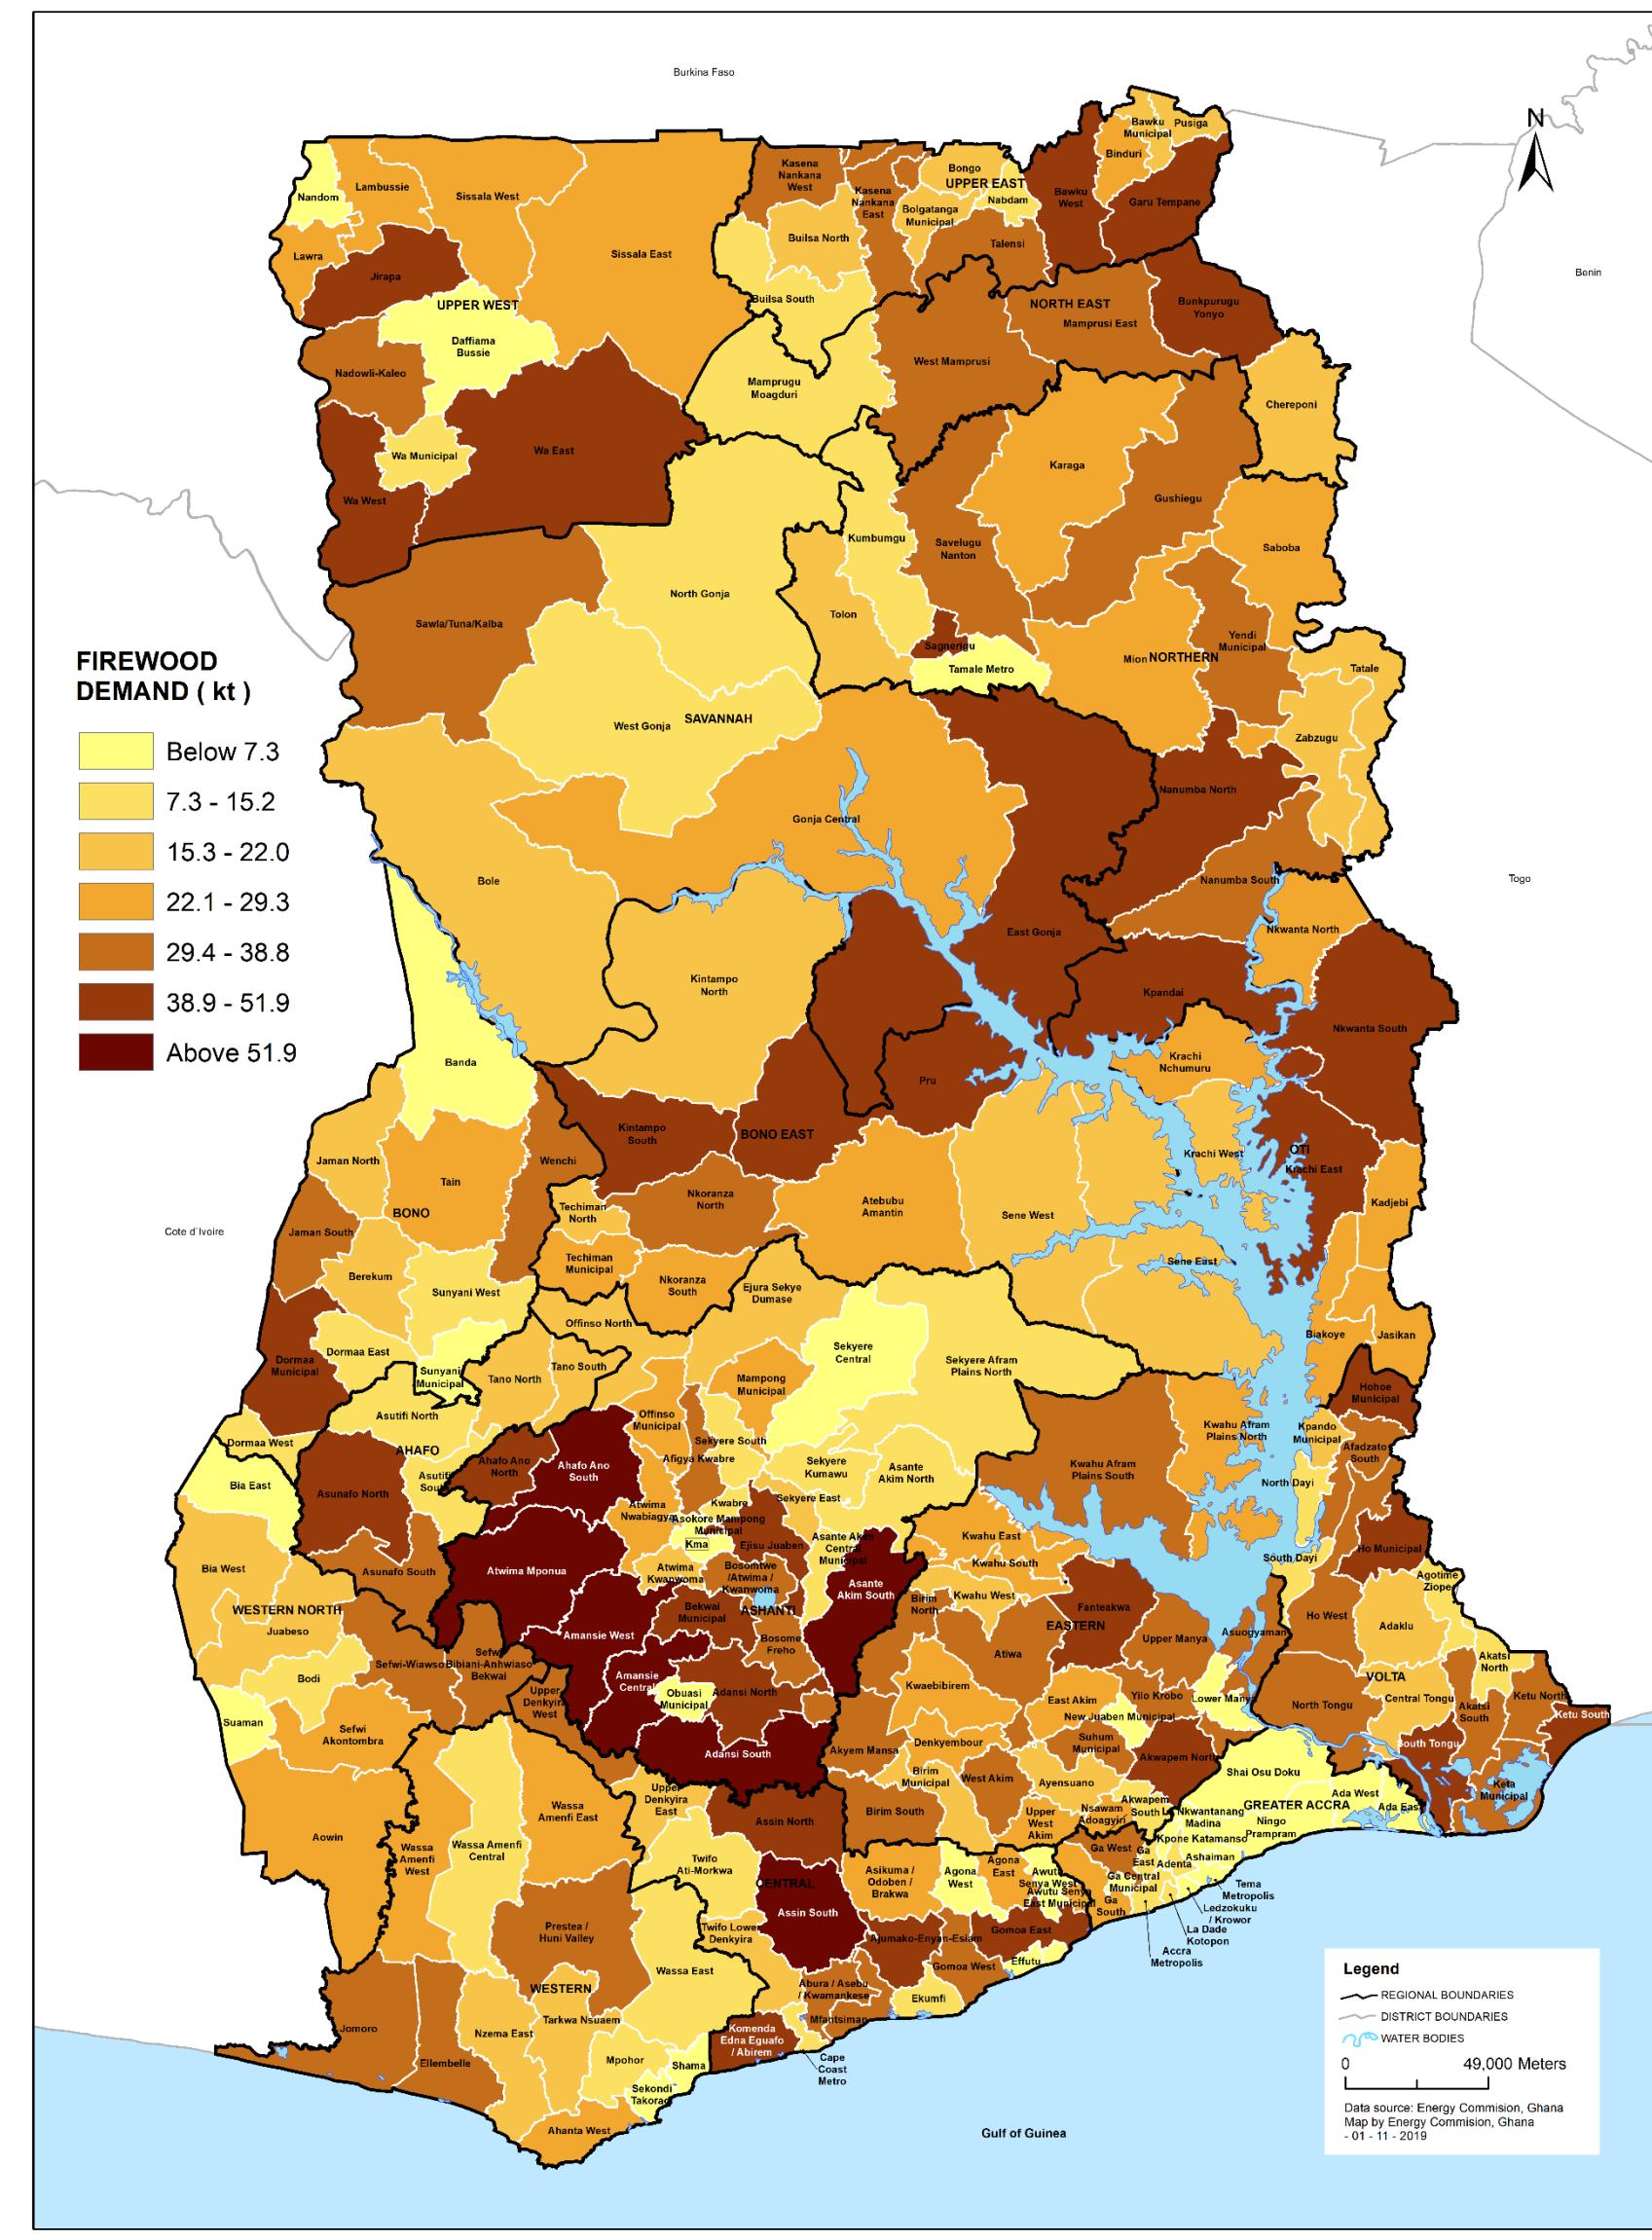

Fig. 7: Residential Firewood Demand

## 4.2 Charcoal Demand

The projected residential charcoal demand for the various districts are presented in Figure. 8. The district that would have the highest demand for charcoal is projected to be the Kumasi Metropolitan Assembly (KMA) in the Ashanti Region with an estimated charcoal demand of 143.4 kt. This would be followed by Accra Metropolitan Assembly (AMA) (Greater Accra Region) with a projected charcoal demand of 106.2 kt. The following districts; Sekondi Takoradi Metropolis (Western Region), Ga South Municipal (Greater Accra Region) and Asokore Mampong Municipal (Ashanti Region) would be the third highest consuming districts with their respective charcoal demands being, 47.1 kt, 24.4 kt and 19.2 kt .The district projected to have the least demand is Wa East (Upper West Region) with an estimated projected demand of 0.07 kt. Table 40 depicts the regional average demand and share in the overall charcoal demand in descending order of magnitude. Greater Accra Region would have the highest average demand of 15 kt and Ashanti region having the highest share of 25.7%.

Table 40: Average charcoal demand and share of the various regions

Region	Average Demand per District (kt)	Regional share of total demand (%)
Ahafo	2.8	1.7
Ashanti	8.5	25.7
Bono	3.4	3.8
Bono East	3.1	3.2
Central	4.0	8.0
Eastern	3.8	10.0
Greater Accra	15.0	24.2
North East	1.5	0.7
Northern	2.1	3.1
Oti	2.0	1.6
Savannah	1.1	0.7
Upper East	2.7	3.5
Upper West	0.9	1.0

Western	4.6	7.0
Western North	1.2	0.9

## GHANA 2020 ENERGY DEMAND PROJECTION TOTAL RESIDENTIAL CHARCOAL DEMAND

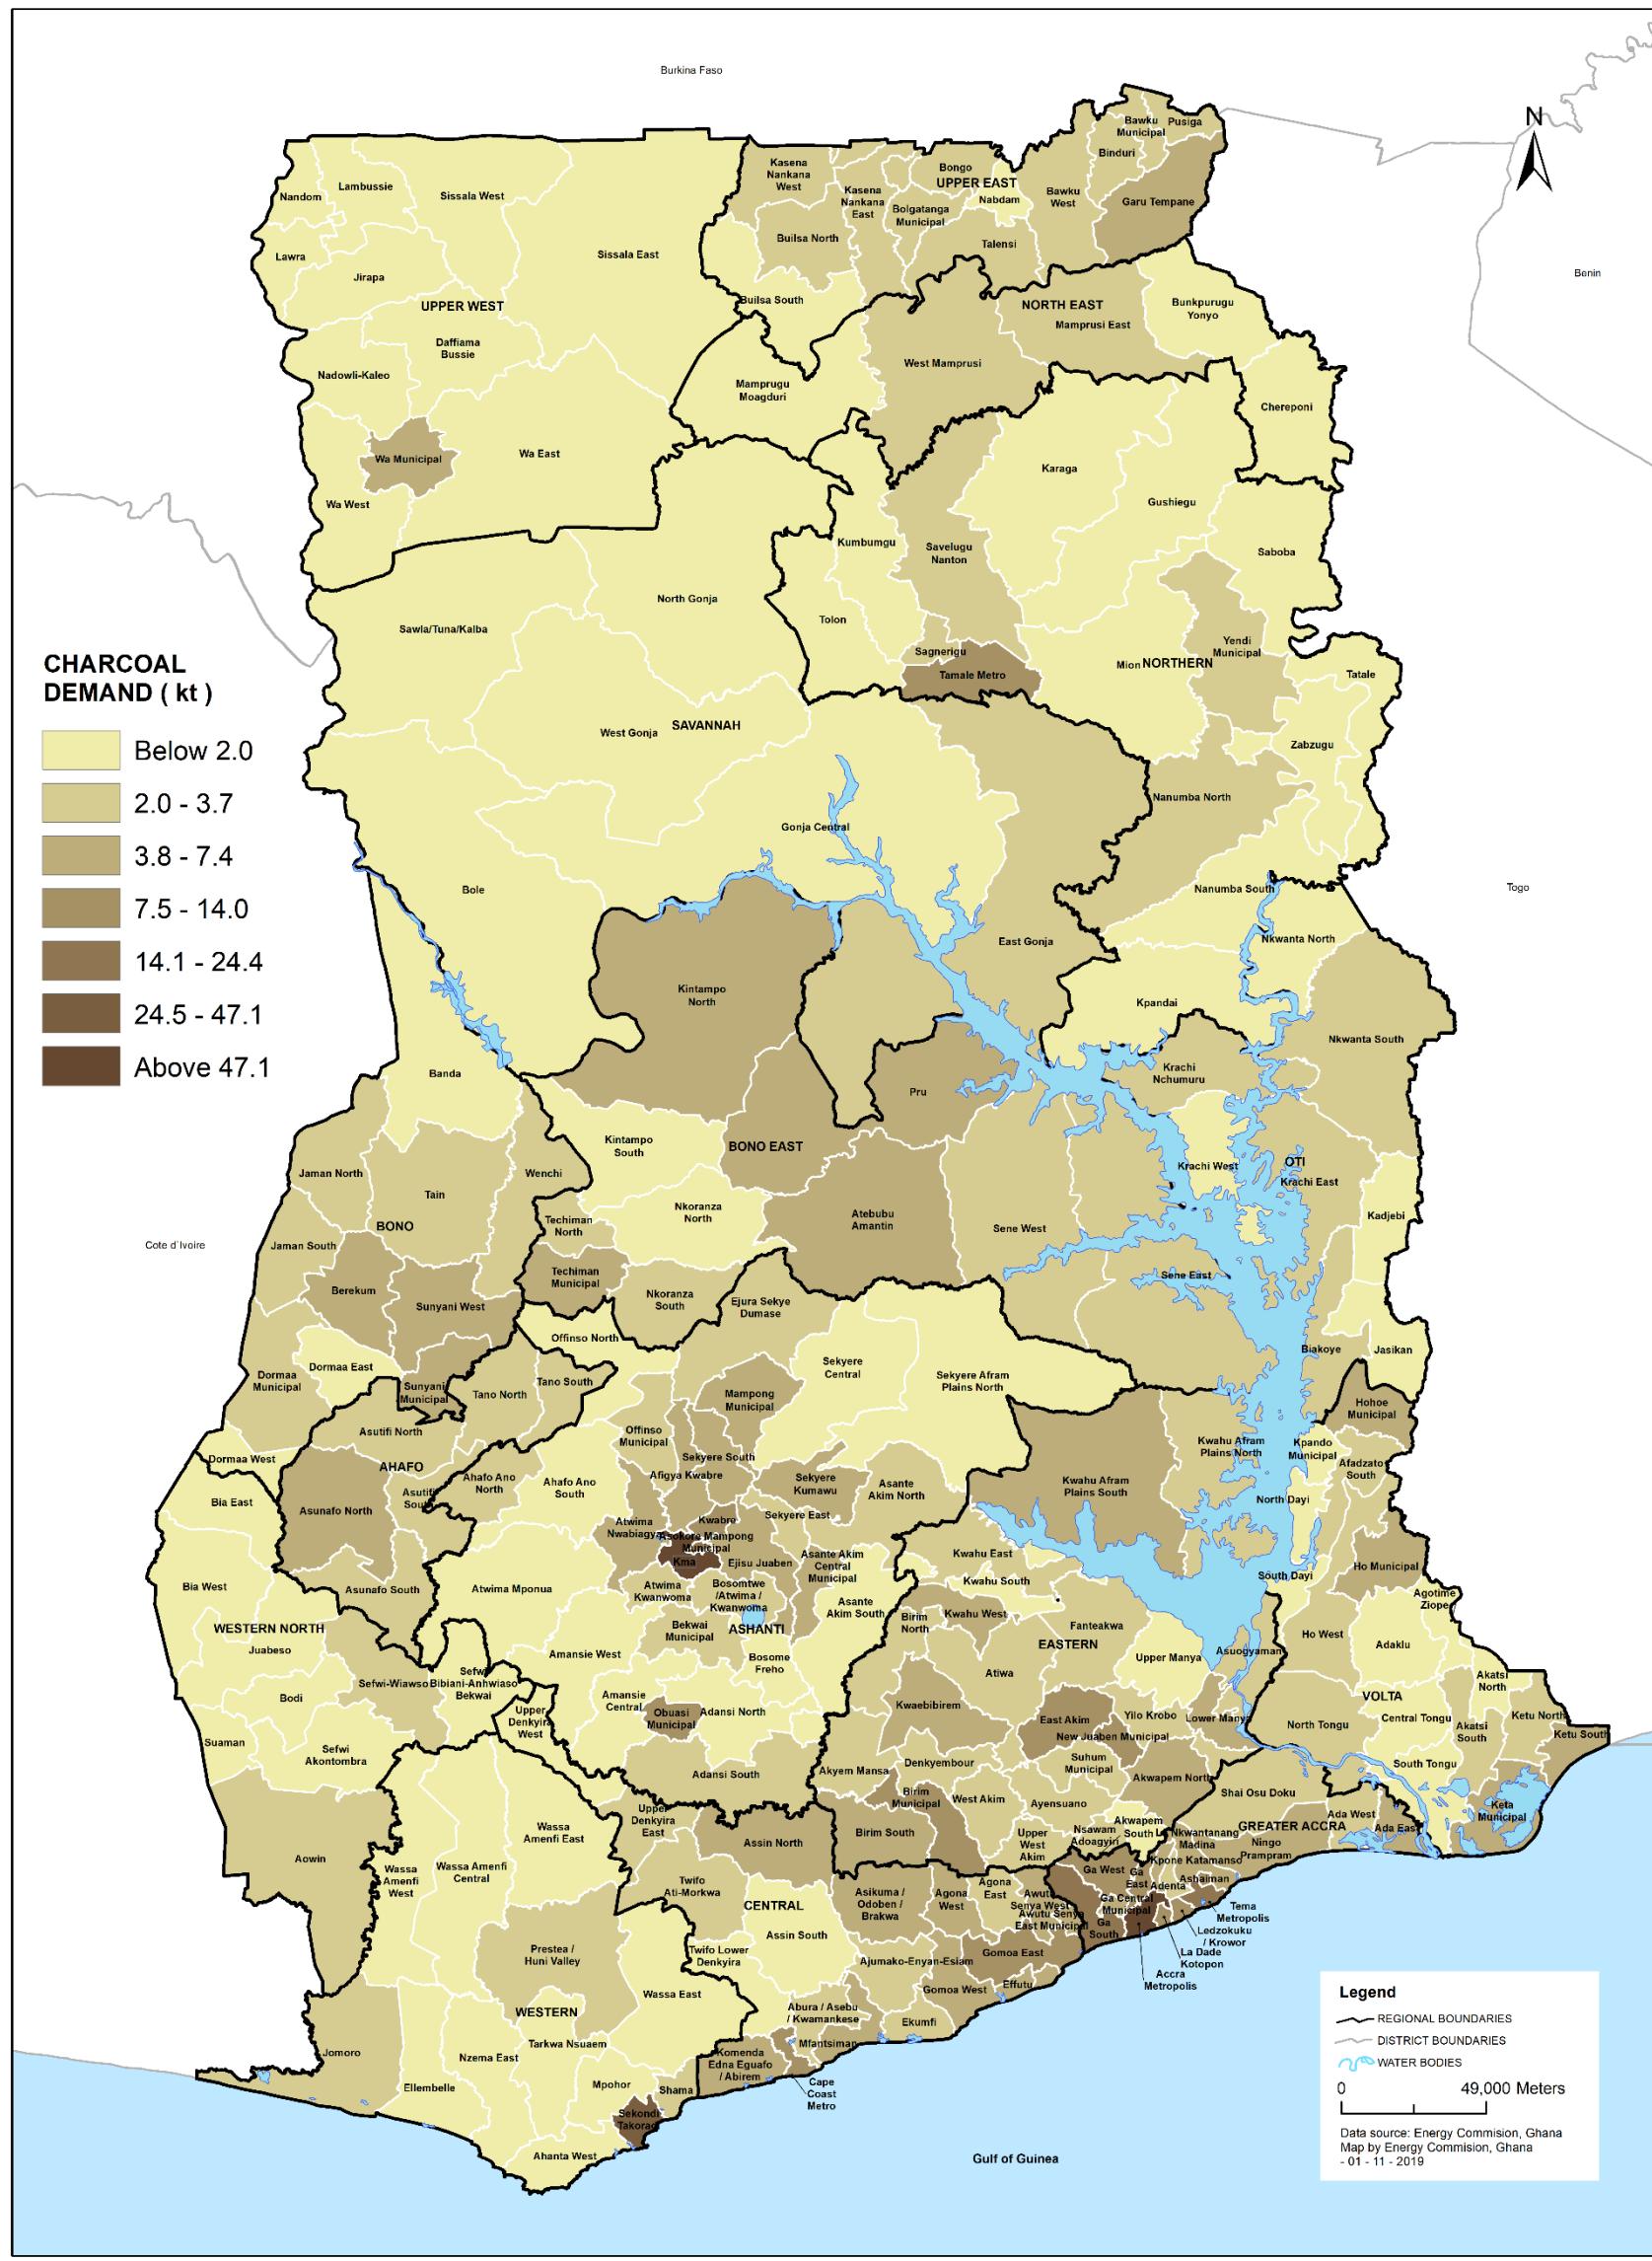

Fig. 8: Residential Charcoal Demand

### 4.3 Kerosene Demand

The projected residential kerosene demand for the various districts are presented in Figure. 9. In 2020, the district with the highest demand would be Atwima Wabiagya in the Ashanti region with a demand of 0.087 kt. This would be followed by Afigya Kwabre, Ejisu Juaben Municipal, Asante Akyim South and Atwima Kwanwoma all in the Ashanti region with their demands being 0.081 kt, 0.065 kt, 0.0633 kt and 0.0630 kt respectively. The district that is expected to have the lowest demand of kerosene is Wa East (Upper West Region) with a demand of 0.07 kt. Table 41 presents the average demand of the various regions and their share in the overall kerosene demand. The Ashanti Region has the highest average demand and share of 0.033 kt and 34.5 % respectively

Table 41: Average kerosene demand and share of the various regions

Region	Average Demand per District (kt)	Regional share of total demand (%)
Ahafo	0.006	1.2
Ashanti	0.033	34.5
Bono	0.005	1.8

## **TOTAL RESIDENTIAL KEROSENE DEMAND**

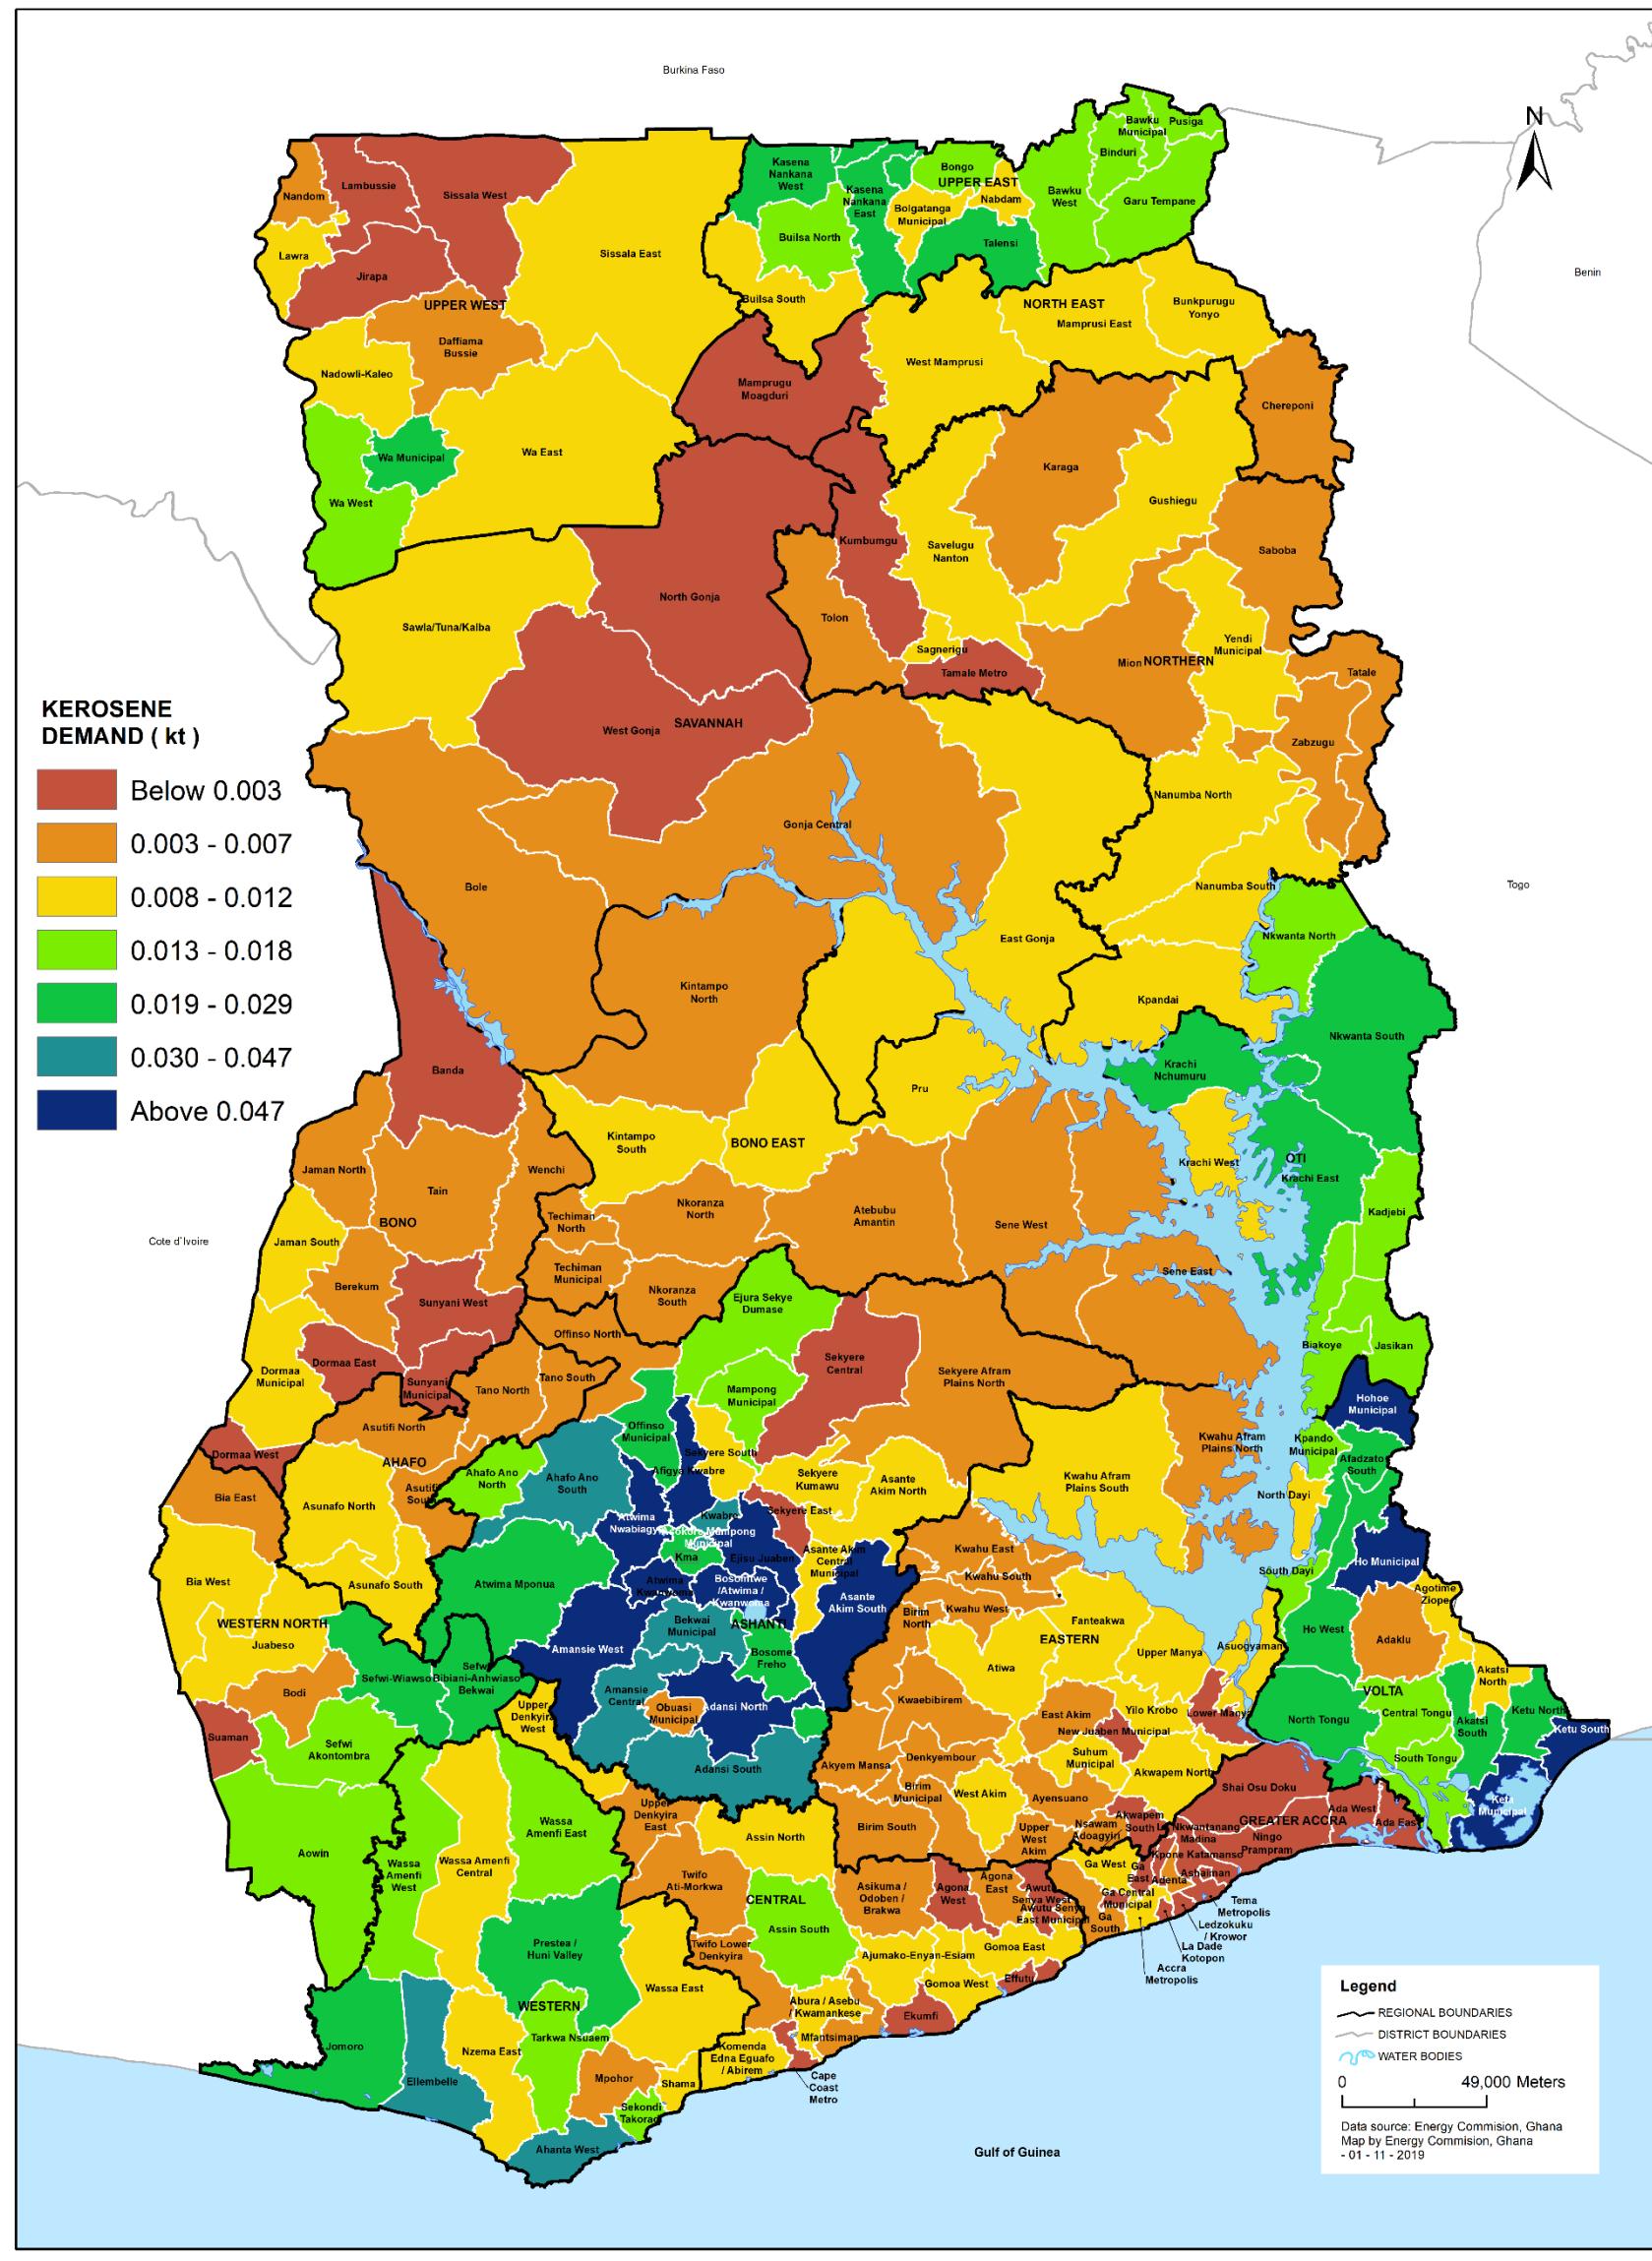

Fig. 9: Residential Kerosene Demand

#### 4.4 LPG Demand

The projected residential LPG demand for the various districts are presented in Figure. 10. The district with the expected highest demand is AMA (Accra Metropolitan Assembly) with a projected LPG demand of 30.2 kt. This would be followed by KMA (Kumasi Metropolis) with a projected LPG demand of 19.7 kt. The following districts; Seondi Takoradi Metropolis, Ga South Municipality and Tema Metropolis are projected to have the demand of 7.6 kt, 6.9 kt and 5.1 kt respectively. The district with least projected demand is Wa East (Upper West Region) with a demand of 0.02 kt. Table 42 presents average regional demand and shares in LPG demand. Greater Accra Region would have the highest average regional demand with 15 kt of LPG demand. This region also expected to have the highest share of 32.9 %.

Table 42: Average LPG demand and share of the various regions

Region	Average Demand per District (kt)	Regional share of total demand (%)
Ahafo	0.72	2.1
Ashanti	1.01	14.6
Bono	0.92	4.8
Bono East	0.82	4.0
Central	1.05	10.2
Eastern	1.0	12.6
Greater Accra	4.25	32.8

Volta	0.73	6.0
Western	0.63	4.5
Western North	0.14	0.5

## GHANA 2020 ENERGY DEMAND PROJECTION TOTAL RESIDENTIAL LPG DEMAND

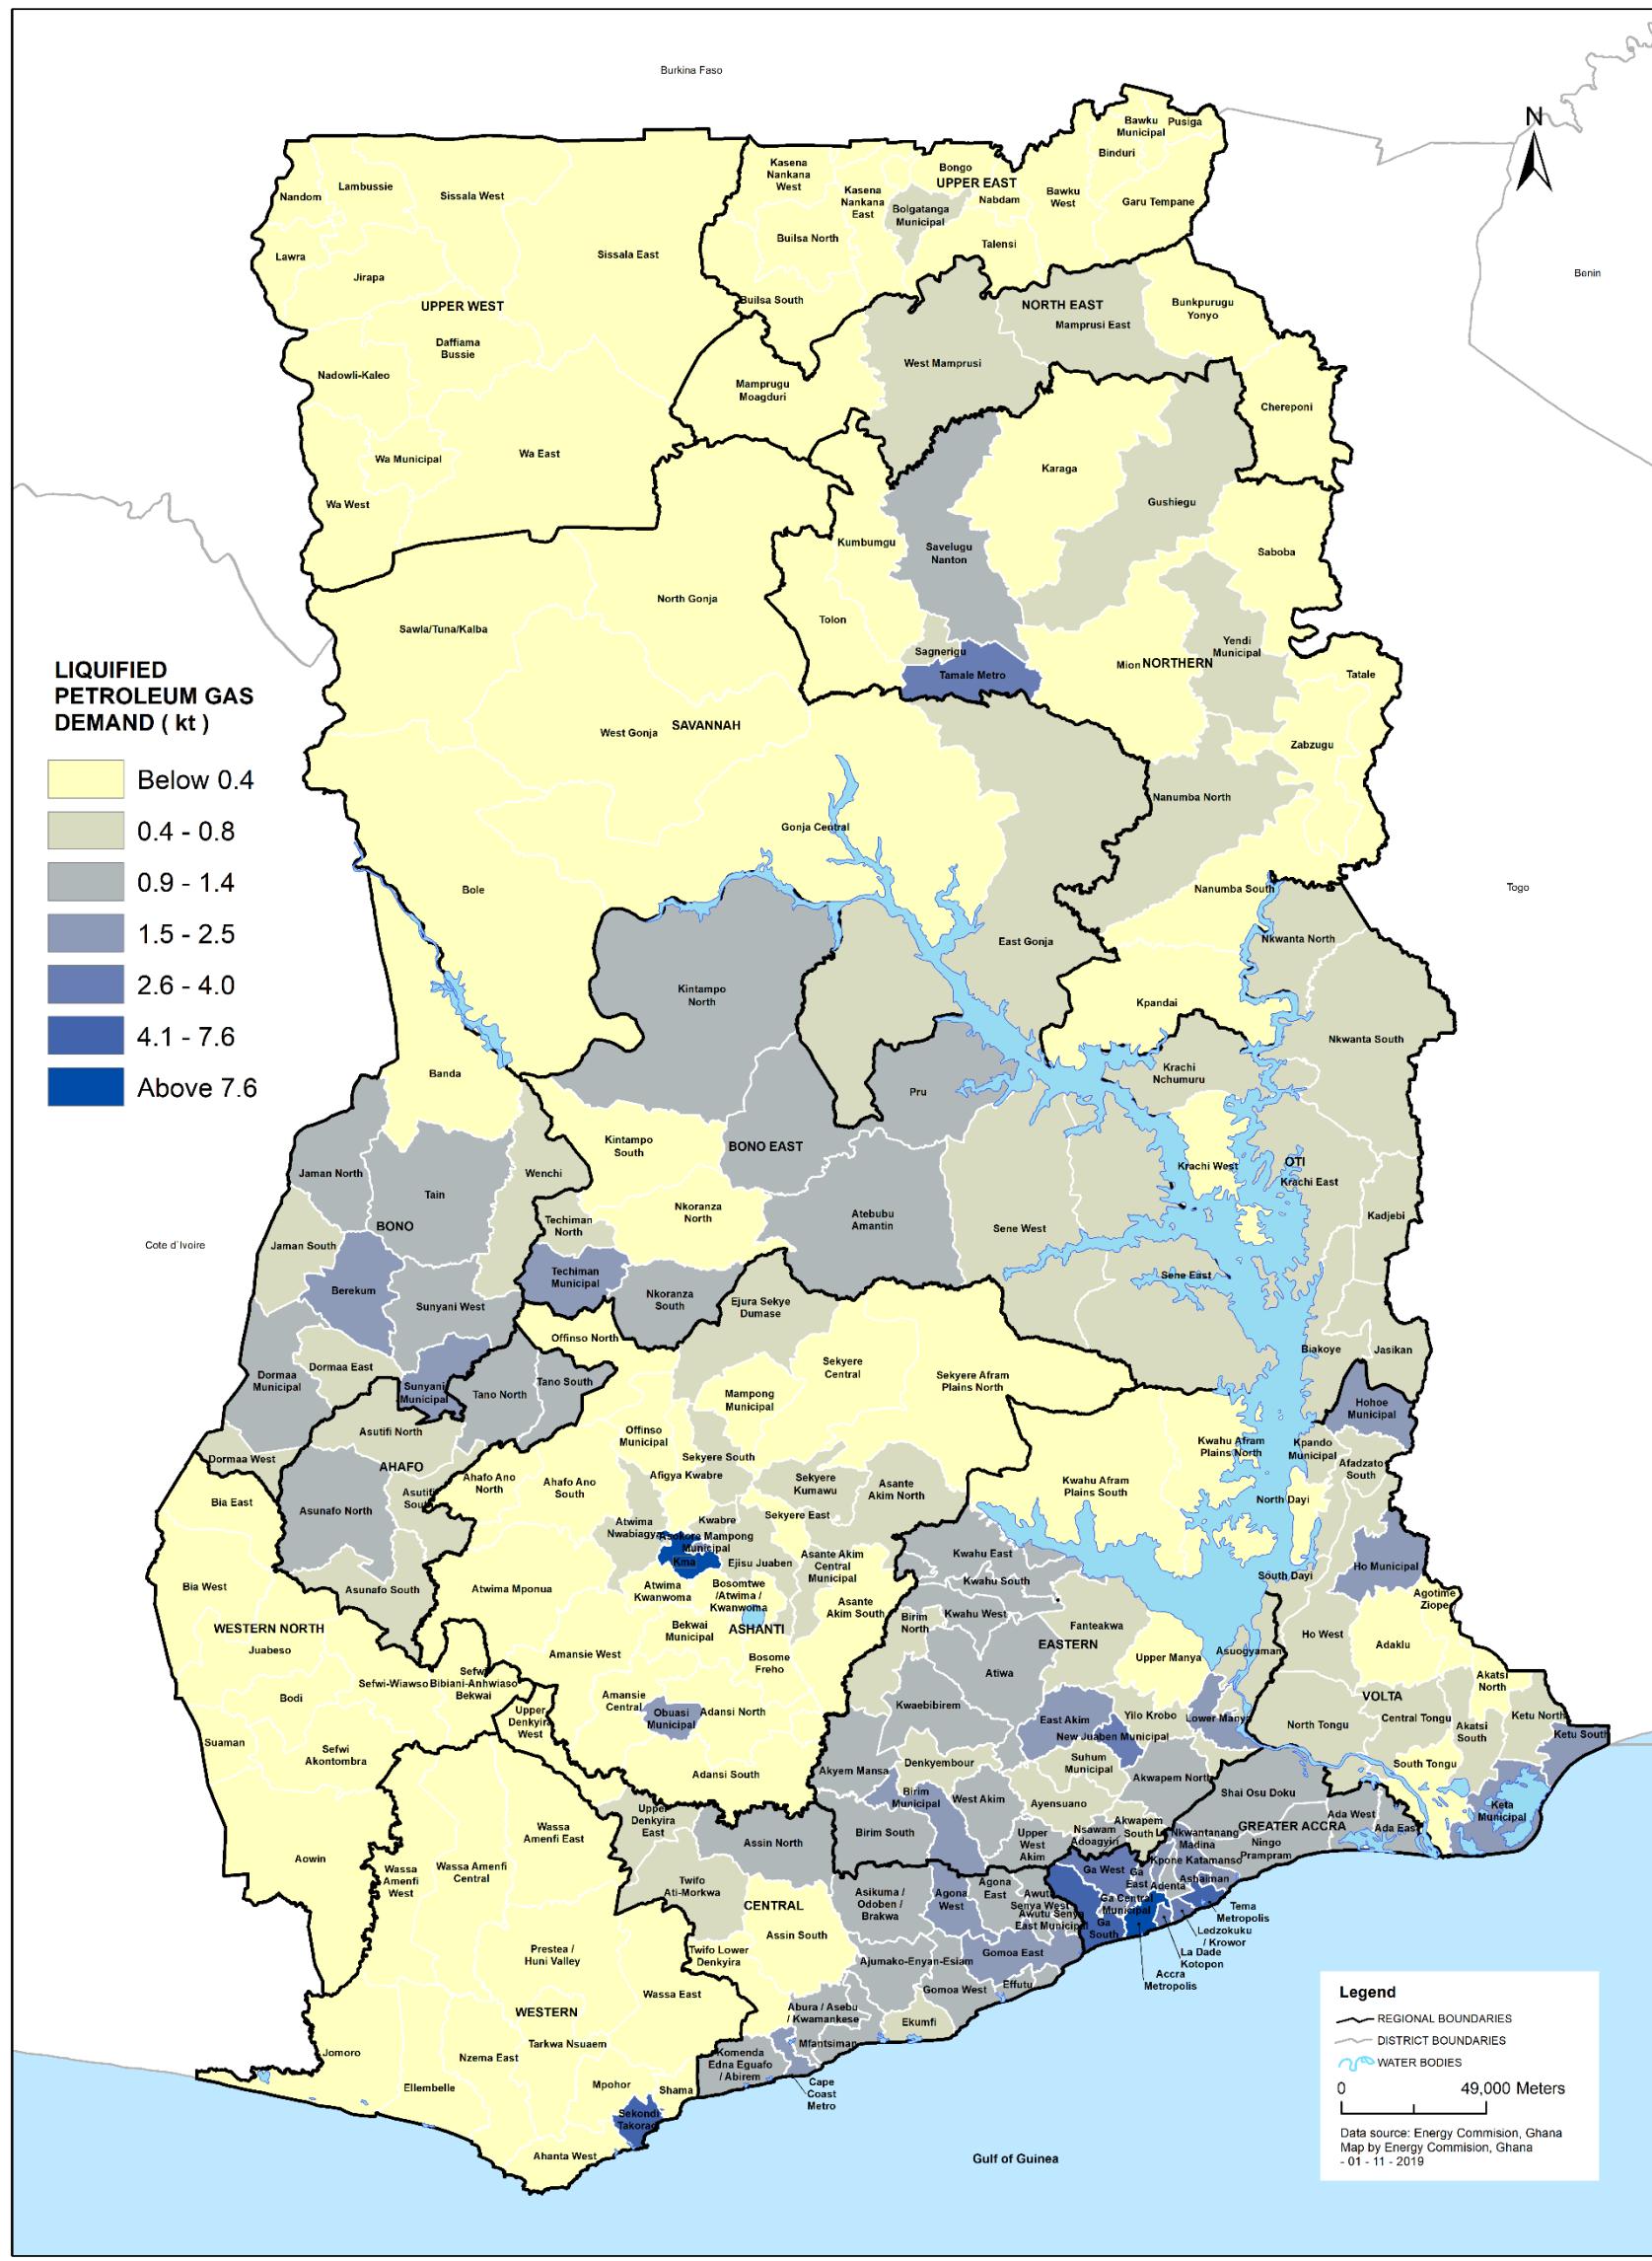

Fig. 10: Residential LPG Demand

## 4.5 Electricity Demand

The projected residential electricity demand for the various districts are presented in Figure. 11. The district with the highest demand is expected to be Kumasi Metropolitan Assembly (KMA) with a demand of 836.5 GWh. This would be followed by Accra Metropolitan Assembly (AMA) with 644.5 GWh, Sekondi Takoradi Metropolis, Asokore Mampong Municipality and Ga South Municipality with electricity demands of 661.9 GWh, 196.1 GWh and 150.9 GWh respectively. The district with the lowest electricity demand is expected to be Offinso North (Ashanti Region) with a total electricity demand of 4.8 GWh. Table 43 presents average demand of the various regions and their share in overall electricity demand. Greater Accra Region would have the highest average demand with 92.1 GWh followed by Ashanti and Western Regions with average demands of 66.2 GWh and 64.9 GWh respectively. The Ashanti region would have the highest share of electricity demand with 35.5 %.

Table 43: Average electricity demand and share of the various regions

Region	Average Demand per District (GWh)	Regional share of total demand (%)
Ahafo	19.6	1.6
Ashanti	66.2	26.1
